Institute for Water and Environmental Engineering

Announces

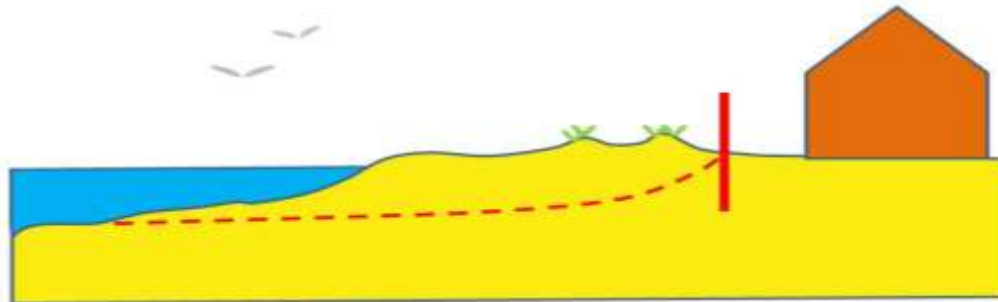

“SETBACKS 2”

A 2-day Seminar & Workshop

The development of coastal setback lines 2011

Presented by the University of Stellenbosch : 6 & 7 October 2011

Venue : Stias Centre, Stellenbosch University Campus, South Africa

An open invitation is extended to all who are interested to attend as an opportunity to interact with professionals, peers and students involved in studying, determining or implementing the setback lines for coastal developments.

The 2-days will comprise numerous presentations from practicing South African professionals and researchers in this field. We are also very honoured to welcome a guest speaker from Australia, Professor Ron Cox, (Univ. NSW) who will present a review of the latest research, methodology and practice for setback line determination and implementation in Australia and considerations of sea level rise impacts.

This event is a follow-up to the successful October 2010 event and will be of a similar format. As a “follow-up” the focus will be to provide an update of the experience with setback line determinations based on recent projects. Research and new developments will be presented in the technique and application of the methodologies for determining and implementing setback lines in South Africa.

A proposed programme and registration form will be circulated in early September
